

Six Concepts for Successful Product Development and Launch

I have identified six elements that I believe important to successful product development and product management. These concepts are from experiences developing and managing over 40 product lines that provided new revenue and increased the long term value for GE, Honeywell, Ericsson, and Meritor. These concepts cover the gamut from knowing your customers' needs and wants to fast prototyping (which was in vogue long before 3D printers) and marketing internally first.

The concepts are:

1. Know your customers needs - not just their wants
2. Develop multiple product ideas and review with key customers
3. Get to a working prototype quickly
4. Involve the supply chain early in the process
5. "Sell" the product to your sales force
6. Launch the product to key customers early to drive others' demand

Know your customer's needs - not just their wants

Most customers think they know their markets' needs extremely well. In reality they know a combination of their market's wants and needs and assume all are needs. To maximize the value you provide to your customers, provide them with information and products about the market's needs and wants, and clearly differentiate the two.

The chart below shows the value you can provide to your customers. The more new and useful information you can give them, the more value you provide. The most value happens when you reveal market needs to them they are unaware of.

IMPROVING INDIVIDUAL AND ORGANIZATIONAL PERFORMANCE

	NEEDS	WANTS
UNKNOWN	<ul style="list-style-type: none">• Critical to Their Success• “Don’t Know What They Don’t Know”• HIGHEST VALUE	<ul style="list-style-type: none">• Customer is missing important information• High value
KNOWN	<ul style="list-style-type: none">• Common solution providers are here• Most needs are known• Low Value Added	<ul style="list-style-type: none">• Common solution providers are here• Most wants are known• Low Value Added

Develop multiple product ideas and review with key customers

This activity creates early adopters.

Great customers love to collaborate with their supplier partners. They know that by working directly with industry’s leading suppliers, they can be on the cutting edge and be perceived as an industry leader.

If you are good at Step 1, knowing their needs and wants, then developing solutions and options is an obvious Step 2. Taking these early concepts and ideas to your customers is a great way to get fast feedback and direction from them. This input will increase your effectiveness and decrease your time to market.

There are some risks to be aware of in doing this. If they do not like your concept, it is better to know it earlier rather than later. The second is that they do not keep your concept in confidence. This is a sticky situation. You want to trust them but you must be cautious. NDA’s are the safest route and if there is a good relationship, signing one should not be a problem.

Get to a working prototype quickly

This step is the key to keeping the momentum and capitalizing on the good will created during the collaboration with key customers.

This is one of the cornerstones of the AGILE product development methodology. Geared mainly at software development, it can work well in the development of physical products too. The use of rapid prototyping and 3D printing can provide a physical model within a few days that can then be reviewed by the early adopters. With

feedback received, changes can be made and reviewed within weeks instead of months.

“Sell” the product to your sales force

Once you have received and incorporated the appropriate feedback from your customers, it is time to begin the internal sales mission. Your internal teams, primarily the sales force, will be your toughest customers. They know the customers better than anyone in the company. Their reputation is on the line every day when they meet with them. These teams are the ones that have to present the new product to the customers and persuade them to buy or try the product. If the sales personnel do not believe in the product, they will not put forth the effort necessary for success.

You must convince the sales managers of the value of this product. The data, feedback, and endorsements from the key customers is a great way to do this. If they know the product owner has researched the market, discussed it with their customers, and incorporated at least some of the data, then they will be confident the customer will be interested. This confidence will increase their enthusiasm when presenting the product, which will positively impact sales.

Launch the product to key customers early to drive others’ demand

This is another tool for getting traction in the market quickly and then gaining sales momentum. These early wins can occur before the product is available to all customers. Pre-selling products shows the sales force the potential of the product line. It also drives demand by showing your other customers that this product is popular and they should be selling it to their customers too.

Most of the success of a new product launch happens because of great communication. Communicating with customers, end-users, and salesmen provides the data input for the new product development cycle. Working with these same groups during development keeps the project on course and them interested. When you launch it, tell these groups first and let them reap the early rewards in exchange for their support. These early rewards will drive your other customers to win too.
